Its amino acid sequence was deduced from a CDNA clone (see AAT89427) isolated from a did sequence was deduced from a CDNA clone (see AAT89427) isolated from a HVVEC CDNA library. Related death domain containing receptor DR3-VI (see AAW31516) has also been identified. Recombinant full-length or domain of DR3 can be extracellular, transmembrane, intracellular or death domain of DR3 can be expressed in transformed host cells. These polypeptides can be used to treat diseases and disorders associated with the inhibition of apoptosis, or to screen for modulator compounds. Antagonists, such as antibodies rasised against DR3-V1, can be used to treat diseases and disorders associated with increased apoptosis and for treatting inflammatory diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                  9

into incorp poptoric activity in mammalian cells purposes. Its amino acid sequence was deduced from a human foetal heart cDNA clone (see AAF91180).

Competence was deduced from a human foetal heart cDNA clone (see AAF91180).

The N-terminal 181 amino acids of Apo-3 are identical to the sequence of another novel apoptosis polypeptide, Apo-211 (see AAF87679). Also claimed are: polypeptides comprising the extracellular or death domain of Apo-3; chimeric molecules comprising Apo-1 fused to a heterologous amino acid sequence; antibodies that bind to Apo-3 or its extracellular domain; cells; a non-human transgenic animal containing cells that express contoining an altered Apo-3; and a non-human knockout animal containing cells having an altered Apo-3 gene. Apo-3 can be used to induce apoptosis or NF-kB induction or JNK activation for therapeutic purposes. Apo-3-1gG fusion proteins can be used to inhibit apoptosis or used as immunogens for anti-Apo-3- antibody production. Apo-3 or Apo-2011 can also be used as assay standards. The animals can be used in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 CTEPCGNSTCLVCPQDTFLAWENHHNSECARCQACDEQASQVALENCSAVADTRCGCKPG 120

The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DR3-V1 and DR3. The DR3-V1 cDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 97757. Recombinant vectors comprising the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents the amino acid sequence of a death domain containing receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is the human apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can be used to requist of block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or I cells expressing AIR in autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents tumour necrosis factor receptor (TNFR) TR31, also known as DR3, Apo3, WSL-1 or LARD. The invention relates to TNFR related polypeptides TR1, TR3 and TR5 (see AAVS0574-44) and their ligand TL3 (see AAVS05745). TR1, TR3, TR5 and TL3 are used in claimed methods of identifying agonists and antagonists, i.e. compounds that bind

to the receptors or ligand, and which activate (agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or TL3. A screening kit for identifying agonists, antagonists, ligands, receptors, substrates, enzymes etc. for TR1, TR3, TR5 or TL3 polypeptides is provided. The agonists and antagonists are useful for treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune disease e.g. inflammatory bowel disease, psoriaats, transplant rejection, graft versus host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restencesis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atheroscierosis, Alzheimer's disease, etc., caused by imbalance of TR1, TR3, TR5 or TL3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This invention relates to a method of diagnosing chronic rheumatoid arthritis by digesting human genomic DNA with BCORI and hybridising it with a probe for the DNA encoding the present protein which is a rheumatoid arthritis associated transmembrane protein. The method is used for the diagnosis of chronic rheumatoid arthritis, and for developing new

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     요
                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences for two death domain containing receptors, designated DR3 and DR3-V1. These receptors are involved in apoptosis, and the sequences given can be used in the treatment of cancers, inflections, cardiovascular disorders such as arrhythmias, ischaemia, aneurysms, arterial occlusive diseases, embolisms and congenital heart defects, neurodegenerative diseases including Alzheimer's and Parkinson's diseases, autoimmune disease such as multiple sclerosis, arthritis, diabetes, Graves disease, asthma and psoriasis, and to promote angiogenesis and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEALTPPPATHLSPLDSAHTLLAPPDSSEKICTVQLVGNSWTPGYPETQBALCPQVTWSM 300

              RESULT
                                               with rheumatoid arthritis. Certain mutations in the gene can be linked to the disease. The sequences can be used to evaluate disease onset and its possibility and to provide therapy and remedies. The present sequence is a protein described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, anegonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO polypeptides of the invention

This invention relates to an isolated monoclonal antibody comprising an antigen binding site which binds to an Apo-2 ligand inhibitor (Apo-2LI) polypeptide and an antibody that binds the Apo3 protein. The antibodies of the invention may have cytostatic activity and may act as activators of the invention may have cytostatic activity and may act as activators or stimulator of apoptosis in cancer cells, as blockers of excessive apoptosis or of the autoimmune/inflammatory effects of Apo-3 resulting from nuclear factor (NF) kappaB activation or C-Jun-amino-terminal kinase (JNK) activation. The anti-Apo-2 ligand inhibitor is useful in thermodegenerative disease), or to block potential autoimmune/ cells and may be used to block excessive apoptosis (for example in neurodegenerative disease), or to block potential autoimmune/ cells and may be used in diagnostic assays for Apo-2LI or Apo-3, e.g. cetecting Apo-2LI or Apo-3 resulting from nuclear factor (NF)-kappaB activation or C-Jun-amino-terminal kinase (JNK) activation. The antibody may also be used in diagnostic assays for Apo-2LI or Apo-3, e.g. cerum, or for affinity purification of Apo-2LI or Apo-3 from recombinant cell culture or natural sources. The present sequence represents the human Apo3 protein which was used to generate the antibody of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an new isolated biologically active Apo-2LI or Apo-3 having at least 80 % sequence identity with native sequence Apo-2LI or Apo-3 appearing as ABU08251 and ABU08225. Also included are a chimaeric molecule comprising the Apo-2LI fused to a hererologous amino acid sequence; a dimer molecule comprising a first Apo-2LI and a second Apo-2LI, an antibody that binds to Apo-2LI or Apo-2LI and a second Apo-1LI, an antibody that binds to Apo-2LI or Apo-2LI and a second correctly a vector comprising the nucleic acid, a host cell comprising the vector, a method of producing Apo-2LI and a non-human (transgenic or Knockout) animal that contains cells that express nucleic acid encoding Apo-3 or cells having an altered gene encoding Apo-3. Apo-2LI or Apo-3 are involved in apoptosis (programmed cell death) which is implicated in Apo-3 or cells having an altered gene encoding Apo-3. Apo-2LI or Apo-3 are involved in apoptosis (programmed cell death) which is implicated in Apo-3 are also variation and takens cerebellar degeneration, reperfusion, reperfusion and takens sclerosis, multiple sclerosis, retinitis pigmentosa, aplastic anaemia, cerebellar degeneration, myocardial infarction, reperfusion injury and toxin-induced liver myocardial infarction, reperfusion injury and toxin-induced liver cancer. The gene for both proteins is located on chromosome 1936.3 Apo-2LI and Apo-3 are also useful for preparing a composition for treating cancer. The present sequence represents Apo-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CTEPCGNSTCLVCPQDTFLAWENHHNSECARCQACDEQASQVALENCSAVADTRCGCKPG 120

Towells of apoptosis are associated with diseases such as acquired immunodeficiency syndrome (AIDS), Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, multiple sclerosis, retinitis disease, amyotrophic lateral sclerosis, multiple sclerosis, retinitis pigmentosa, cerebellar degeneration, aplastic anaemia, myocardial infarction, stroke, reperfusion injury, and toxin-induced liver disease. The Apo-3 polypeptide is also useful in non-therapeutic applications such as in quantitative diagnostic assays as a control against which samples containing unknown quantities of Apo-3 may be prepared, in generating antiques, and in competitive-type receptor binding assays. The chimeric cechniques, and in competitive-type receptor binding assays. The chimeric molecule is useful therapeutically to inhibit apoptosis or nuclear factor kappa B (MP-kappa B) induction, or as an immunogen for producing anti-Apo-3 antibodies. The present sequence represents the polypeptide sequence of the human Apo-3 protein present in the foetal heart
                                                                                                                                                                                                                                                                                                                         The invention relates to an Apo-3 polypeptide having an extracellular domain (BCD) sequence and a death domain sequence. The Apo-3 polypeptide has been found to stimulate or induce apoptotic activity in mammalian cells. Human Apo-3 exhibits similarities to the tumour necrosis factor receptor (TNFR) family of polypeptides. The invention also relates to a reimeric molecule comprising an extracellular domain sequence comprising residues 1-198 of Apo-3 fused to a heterologous amino acid sequence. The Apo-3 polypeptide is useful therapeutically to induce apoptosis in mammalian cells. Decreased levels of apoptosis has been associated with conditions such as cancer, lupus, and herpes virus infection. Increased
                                                                                                                                              Novel isolated Apo-3 polypeptide useful for inducing apoptosis in mammalian cells, for generating antibodies, in affinity purification techniques, and in competitive-type receptor binding assays.
                                                                                                                                                                                                                                                                    Claim 1; Fig 8; 52pp; English.

The invention relates to an isolated Apo-3 polypeptide. The Apo-3 polypeptides are useful for stimulating or inducing apoptotic activity in mammalian cells e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques. The Apo-3 chimeric molecules are useful for inhibiting apoptosis, or as immunogens used in generating antibodies. The antagonistic antibodies may be used to block excessive apoptosis, for instance in neurodegenerative disease, or to block potential autoimmune/inflammatory effects of Apo-3 resulting from NF-kappas activation. The nucleic acid sequences are useful as diagnostics for tissue-specific kryping, for preparing Apo-3 polypeptides, or for generating transgenic or knockout animals. The transgenic or knockout animals are useful in developing and screening of therapeutically useful reagents. The present sequence represents the amino acid sequence of human Apo-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated Apo-3 polypeptides, useful for stimulating or inducing apoptotic activity in mammalian cells, e.g. cancer cells, or for in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MEQRPRGCAAVAAALLLVLLGARAQGGTRSPRCDCAGDFHKKIGLFCCRGCPAGHYLKAP

The present invention describes the use of an agonist or antagonist of GENCEPTIN activity for preventing or treating obesity. Also described is a method of screening for GENCEPTIN activity, for preventing or treating obesity. Also described is a method of screening for GENCEPTIN setty acid oxidation, and useful insulin-like activity, free fatty acid oxidation, and antarteriosclerotic, cardiant, antidiabetic, hypotensive, ophthalmological, neuroprotective and nephrotropic activities. GENCEPTIN can be used for treating or preventing obesity-related disease or disorders, e.g. obesity, insulin resistance, atherosalerosis, atheromatous disease, heart disease (e.g. cardiac insufficiency, toronary insulin the presents), hypertension, stroke, syndrome X, diabetes mellitus (type I and II), hyperlipidaemia and hyperuricaemia, also diabetic complications, e.g. micromagiopathic lesions, ocular lesions, retinopathy, neuropathy and renal lesions. The present sequence represents human GENCEPTIN, which is given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

                                                                                                                                                                                                                                                                                                                                                                                                 164. .181
/label= Cysteine-rich domain 4
/note= "This cysteine-rich domain is apparently truncated
in Apo-2LI and contains only 3 cysteines instead of 6."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated biologically active Apo-2LI or Apo-3 which has at least 80% sequence identity with native sequence Apo-2LI having 1-181 amino acids or Apo-3 having 1-417 amino acids, respectively. Apo-3 can be employed therapeutically to induce apoptosis or NF-kappaB or JNK mediated gene expression in mammalian cells. The Apo-3 chimeric molecules can be employed therapeutically to inhibit apoptosis; necrosis factor (NF)-kappaB induction, c-Jun N-terminal kinase (JNK) activation. Apo-2LI can be employed therapeutically to inhibit mammalian cell
                                                                                                                                                                                                                                                                                                            /note= "Specifically claimed in claim 4. Residues 1-181 of Apo-3 represent Apo2LI"
                              417
                                                                                                                                                                        human; Apo-2 ligand inhibitor; Apo-2L1; apoptosis; NF-kappaB; JNK; c-Jun N-terminal kinase; necrosis factor kappa B; chimeric molecule; tissue-specific typing; Apo-3; transgenic; affinity purification; competitive-type receptor binding assay.
        New isolated biologically active Apo-2LI or Apo-3 used to induce apoptosis in mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                           16. 163

apoptosis in vivo or ex vivo. Nucleic acid sequences encoding the Apo-3 or Apo-2LI may be used as a diagnostic for tissue-specific typing. The isolated Apo-2 an Apo-2LI may be used in quantitative diagnostic assays as a control against which samples containing unknown quantities of Apo-3 or Apo-2LI may be prepared. Apo-3 preparations are also useful in generating antibodies, as standards in assays for Apo-3 or Apo-2LI, in affinity purification techniques, and in competitive-type receptor fluorophores. Modified forms of the Apo-3, e.g. Apo-3 or Apo-3. In the conclusion assays when labelled with, e.g. radioiodine, enzymes, or fluorophores. Modified forms of the Apo-3, e.g. Apo-3-1gG chimeric and be used as immunogens in producing anti-Apo-3 antibodies. Nucleic acids which encode Apo-3 or its modified forms can also be used to generate either transgenic animals or knock out animals, e.g. mouse or rat, which, in turn, are useful in the development and screening of therapeutically useful reagents. The Apo-3 polypeptide stimulates or induces apoptotic activity in mammalian cells. The present sequence represents the human apoptotic protein, Apo-3 Residues 1.181 of Apo3 cepting applied or apoly a secreted or soluble form of Apo3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumor necrosis factor receptor
superfamily member 23.
Removed in mature form (Potential).
GPI-anchor amidated cysteine (Potential).
Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Receptor for the cytotoxic ligand TRAIL. Lacks a cytoplasmic death domain and hence is not capable of inducing apoptosis. May protect cells against TRAIL mediated apoptosis through ligand competition. Cannot induce the NF-kappa-B pathway.
-!- SUBCELLUIAR LOCATION: Attached to the membrane by a GPI-anchor.
-!- TISSUE SPECIFICITY: Ubiquitous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9; Gaps
